Pin summary

A20M#	I	Address bit 20 Mask is an emulator signal.
A31..A3	IO	Address , in combination with byte enable , indicate the physical addresses of memory or device that is the target of a bus transaction. This signal is an output, when the processor is initiating the bus transaction, and an input when the processor is receiving an inquire transaction or snooping another processor's bus transaction.
ADS#	IO	Address Strobe , when asserted, indicates new bus transaction by the processor, with valid address and byte enable simultaneously driven.
ADSC#	O	Address Strobe Copy is driven identically to address strobe
AHOLD	I	Address HOLD , when asserted, causes the processor to cease driving address and address parity in the next bus clock cycle.
AP	IO	Address Parity contains even parity on the same cycle as address . Address parity is generated by the processor when address is an output, and is checked when address is an input. A parity error causes a bus error machine check.
APCHK#	O	Address Parity CHeck is asserted two bus clocks after EADS# if address parity is not even parity of address .
APICEN	I	Advanced Programmable Interrupt Controller ENable is not implemented.
BE7#..BE0#	IO	Byte Enable indicates which bytes are the subject of a read or write transaction and are driven on the same cycle as address .
BF1..BF0	I	Bus Frequency is sampled to permit software to select the ratio of the processor clock to the bus clock.
BOFF#	I	BackOFF is sampled on the rising edge of each bus clock, and when asserted, the processor floats bus signals on the next bus clock and aborts the current bus cycle, until the backoff signal is sampled negated.
BP3..BP0	O	BreakPoint is an emulator signal.
BRDY#	I	Bus ReaDY indicates that valid data is present on data on a read transaction, or that data has been accepted on a write transaction.
BRDYC#	I	Bus ReaDY Copy is identical to BRDY#; asserting either signal has the same effect.
BREQ	O	Bus REQuest indicates a processor initiated bus request.

Fig. 48

BUSCHK#	I	BUS CHeck is sampled on the rising edge of the bus clock, and when asserted, causes a bus error machine check.
CACHE#	O	CACHE , when asserted, indicates a cacheable read transaction or a burst write transaction.
CLK	I	bus CLock provides the bus clock timing edge and the frequency reference for the processor clock.
CPUTYP	I	CPU TYPE , if low indicates the primary processor, if high, the dual processor.
D/C#	I	Data/Code is driven with the address signal to indicate data, code, or special cycles.
D63..D0	IO	Data communicates 64 bits of data per bus clock .
D/P#	O	Dual/Primary is driven (asserted, low) with address on the primary processor
DP7..DP0	IO	Data Parity contains even parity on the same cycle as data . A parity error causes a bus error machine check.
DPEN#	IO	Dual Processing Enable is asserted (driven low) by a Dual processor at reset and sampled by a Primary processor at the falling edge of reset.
EADS#	I	External Address Strobe indicates that an external device has driven address for an inquire cycle.
EWBE#	I	External Write Buffer Empty indicates that the external system has no pending write.
FERR#	O	Floating point ERROR is an emulator signal.
FLUSH#	I	cache FLUSH is an emulator signal.
FRCMC#	I	Functional Redundancy Checking Master/Checker is not implemented.
HIT#	IO	HIT indicates that an inquire cycle or cache snoop hits a valid line.
HITM#	IO	HIT to a Modified line indicates that an inquire cycle or cache snoop hits a sub-block in the M cache state.
HLDA	O	bus HoLD Acknowledge is asserted (driven high) to acknowledge a bus hold request
HOLD	I	bus HOLD request causes the processor to float most of its pins and assert bus hold acknowledge after completing all outstanding bus transactions, or during reset.
IERR#	O	Internal ERROR is an emulator signal.
IGNNE#	I	IGNore Numeric Error is an emulator signal.
INIT	I	INITialization is an emulator signal.
INTR	I	maskable INTerrupt is an emulator signal.
INV	I	INValidation controls whether to invalidate the addressed cache sub-block on an inquire transaction.

Fig. 48 (cont'd)

KEN#	I	Cache ENable is driven with address to indicate that the read or write transaction is cacheable.
LINT1..LINT0	I	Local INTerrupt is not implemented.
LOCK#	O	bus LOCK is driven starting with address and ending after bus ready to indicate a locked series of bus transactions.
M/IO#	O	Memory/Input Output is driven with address to indicate a memory or I/O transaction.
NA#	I	Next Address indicates that the external system will accept an address for a new bus cycle in two bus clocks.
NMI	I	Non Maskable Interrupt is an emulator signal.
PBGNT#	IO	Private Bus GraNT is driven between Primary and Dual processors to indicate that bus arbitration has completed, granting a new master access to the bus.
PBREQ#	IO	Private Bus REQuest is driven between Primary and Dual processors to request a new master access to the bus.
PCD	O	Page Cache Disable is driven with address to indicate a not cacheable transaction.
PCHK#	O	Parity CHeck is asserted (driven low) two bus clocks after data appears with odd parity on enabled bytes.
PHIT#	IO	Private HIT is driven between Primary and Dual processors to indicate that the current read or write transaction addresses a valid cache sub-block in the slave processor.
PHITM#	IO	Private HIT Modified is driven between Primary and Dual processors to indicate that the current read or write transaction addresses a modified cache sub-block in the slave processor.
PICCLK	I	Programmable Interrupt Controller CLock is not implemented.
PICD1..PICD0	IO	Programmable Interrupt Controller Data is not implemented.
PEN#	I	Parity Enable , if active on the data cycle, allows a parity error to cause a bus error machine check.
PM1..PM0	O	Performance Monitoring is an emulator signal.
PRDY	O	Probe ReaDY is not implemented.
PWT	O	Page Write Through is driven with address to indicate a not write allocate transaction.
R/S#	I	Run/Stop is not implemented.
RESET	I	RESET causes a processor reset.
SCYC	O	Split CYCle is asserted during bus lock to indicate that more than two transactions are in the series of bus transactions.

Fig. 48 (cont'd)

SMI#	I	S ystem M anagement I nterrupt is an emulator signal.
SMIACT#	O	S ystem M anagement I nterrupt A CTive is an emulator signal.
STPCLK#	I	S T O P C Lo C K is an emulator signal.
TCK	I	T est C Lo C K follows IEEE 1149.1.
TDI	I	T est D ata I nput follows IEEE 1149.1.
TDO	O	T est D ata O utput follows IEEE 1149.1.
TMS	I	T est M ode S elect follows IEEE 1149.1.
TRST#	I	T est R e S e T follows IEEE 1149.1.
VCC2	I	VCC of 2.8V at 25 pins
VCC3	I	VCC of 3.3V at 28 pins
VCC2DET#	O	VCC2 DETect sets appropriate VCC2 voltage level.
VSS	I	VSS supplied at 53 pins
W/R#	O	W rite/ R ead is driven with address to indicate write vs. read transaction.
WB/WT#	I	W rite B ack/ W rite T hrough is returned to indicate that data is permitted to be cached as write back.
